

Move with the **TIMES...**

A jeweller's exposure to crime does not diminish when the store is locked up at the close of business. On the contrary, as night falls, criminals are on the move looking for suitable crime opportunities. It is during this critical period, when jewelers rely mainly on electronic and physical protection measures, that stores are most vulnerable to burglaries.

What you can't see, you can't steal

There have been increased instances of heavy losses suffered during burglaries at jewellery stores and the criminal has little concern about the alarm system and armed response services as he intends to leave the crime scene as quickly as possible.

In an effort to create an obstacle that increases the time the criminal needs to remove jewellery and watches during the night we recommend the installation of a smoke cloak system.

The smoke / fog addresses those critical minutes between the alarm activation and the arrival of the armed response.

By rapidly filling the store with a non-toxic vapour it not only prevents the criminals from seeing but also successfully forces them out of the store allowing more time for the armed response to arrive.

When the density of the vapour drops and the alarm has not been reset, the system automatically refills the area thereby "buying" extended protection until the armed response arrives.

The smoke can also be released by an alarm remote and because it is safe for people, computers, furnishings, etc. you can safely hide in it.
